

Password Strength Analyzer with Custom Wordlist Generator

Introduction

Passwords are the first line of defense in protecting personal and organizational data. This project helps users check the strength of their passwords and generates a custom wordlist for educational cybersecurity awareness.

Abstract

The project evaluates password strength using the Python zxcvbn library. It also generates a custom wordlist based on user inputs such as name, birth year, pet name, and favourite number. The generated wordlist is saved in a text file for demonstration purposes.

Tools Used

- Python 3.13
- VS Code
- zxcvbn Library

Steps Involved

1. Install Python and zxcvbn.
2. Create the Python program.
3. Accept user inputs.
4. Analyze password strength.
5. Generate and save the custom wordlist

Conclusion

This project demonstrates the importance of creating strong passwords and shows how predictable information can be combined into a wordlist. It improves awareness of password security and basic Python programming.
